The invention relates to compositions comprising heterotrineric complexes of tumour necrosis factor (TNF) ligand family members, and their use in the detection, prevention and treatment of disease. In one embodiament, the heterotrimeric complex comprises full-length or extracellular to portions of TRAID and full-length or extracellular portions of other TNF ligand family members, preferably RAMIC. The heterotrimeric complexes of the invention are useful for treating an autoimmune disease, cancer or osteoporosis, and particularly for inhibiting cancer cell proliferation, increasing B cell proliferation, or inducing apoptosis of T cells. A claimed method of inducing apoptosis of T cells comprises administering a heterotrimeric complex consisting of FasL and LIGHT, TNF-alpha, theretotrimeric complex consisting of FasL and LIGHT, TNF-alpha, between the administering a heterotrimeric complex consisting of T cells comprises administering of T cells comprises administering of T cells comprises consisting of TRAIL and CD40L or RAMIC. A claimed method of treating osteoporosis of TRAIL and CD40L or RAMIC. A claimed method of treating osteoporosis comprises administering an antibody against a complex comprising RAMIC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 DDSYWDPNDEESMNSPCWQVKWQLRQLVRKMILRISEETISTVQEKQQNISPLVRERGPQ 120

CC cancers, and other hyperproliferative disorders) using the antibodies, a hybridoma cell line selected from the hybridoma cell lines contained in ATCC Deposit No. PTA-2729, PTA-268, PTA-3269, PTA-2730, PTA-2729, PTA-2289. PTA-3269, PTA-3729, PTA-2289. PTA-3269, PTA-2730, PTA-2729, PTA-2289. PTA-3269, PTA-2730, PTA-2729, PTA-2289. PTA-3269, PTA-2731 and the antibodies expressed by these contained a disease or disorder associated with increased or decreased apoptosis, e.g. cancer (such as colon, breast, uterine, carried associated with increased or decreased apoptosis, e.g. cancer (such as colon, breast, uterine, contained (ALDS), or neurodegenerative disorders (e.g. Alzieimer's contained (ALDS), or neurodegenerative disorders (e.g. Alzieimer's disease, parkinson's disease), autoimmune disorders like multiple sclerosis, Behcet's disease, lupus erythematosus, inflammatory diseases can disorders and in regulating immune response. The promoting angiogenesis, wound healing, and in regulating immune response. Many other diseases and disorders are listed in the specification. The artibody is administered in combination with a chemotherapeutic agent selected from irinotecan, paclitaxel (TRXOL (RTW), and gemcitabine. The antibody is useful as a diagnostic tool to monitor the expression of TRAIL receptor expression on cells, to detect, purify, and target the polypeptides, and in immunosasys for qualitatively and quantitatively measuring levels of TRAIL receptor polypeptides. The present sequence is a human TRAIL receptor associated protein. Note: The present sequence is included in the sequence listing but is not referred to anywhere else in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 DDSYMDPNDEESMNSPCWQVKWQLKQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQ 120

Homo sapiens

acid sequence having 95 % identity to a second amino acid sequence of the variable heavy chain or light chain-complementarity determining regions (WHCDR1)/VLCDR1, VHCDR2/VLCDR2 or WHCDR3/VLCDR3 appearing as ABG71906-ABG71911 being specific for human TRAIL receptors 1-4 (TNF (tumour necrosis factor)-related apoptosis-inducing ligand receptor, also produces TR4, TR5, TR7 and TR10). Also included are an isolated cell that produces the antibody, an antibody that binds the same epitope on a TR4 polypeptide as the antibodies detailed above, detecting expression of a TR4 polypeptide (or detecting, diagnosing, prognosing or monitoring

Novel antibody for treating, or preventing disease or disorder, comprises amino acid sequence having identity to other amino acid sequence of either variable heavy/light chain-complementarity determining regions.

invention relates to an isolated antibody comprising a first amino

Novel isolated antibody that immunospecifically binds tumor necrosis factor delta, useful for treating, preventing or ameliorating Non-Hodgkin's lymphoma, multiple myeloma, rheumatoid arthritis or Sjogren's

Disclosure; Page 216-217; 225pp; English.

The antibody of the invention has dermatological, immunosuppressive, antialibrative runner, antiarthatic, cytostatic, antianaemic, antialibratic, antiarthatic, cytostatic, antianaemic, antialibratic, antiarthatic, cytostatic, antianaemic, tuberculostatic, antialabetic, antiarthatic, antialmatic, antialabetic, antialostatic, antialabetic, antialosoriatic, anti-HIV, tuberculostatic, antialabetic, antialosoriatic, anti-HIV, antiarteriosclerotic, vasotropic, thyromimetic, and haemostatic activity. The antibody or its fragment are useful for treating, preventing or annibody at its fragment are useful for treating, preventing or human, disease or disorder such as autoimmune disease, and graft versus cythematosus, rhematodia arthritis or Sjogren's systemic lupus erythematosus, rhematodia arthritis or Sjogren's systemic lupus erythematosus, rhematodia arthritis or Sjogren's systemic lupus erythematosus, rhematodia arthritis or Sjogren's systemic lupus and disease or disorder associated with aberrant APRIL or APRIL receptor expression or aberrant function of APRIL or APRIL or APRIL or APRIL or APRIL receptor expression or aberrant function of APRIL or APR The invention relates to a novel antibody or its fragment, which immunospecifically binds tumour necrosis factor Delta (TNF-delta/APRIL).

(HUMA-) HUMAN GENOME SCI INC.

Vaughan TJ; Salcedo T, Ruben SM, Rosen CA, Albert VR, Dobson CL, WPI; 2003-140454/13. Novel antibody useful for treating cancers and other hyperproliferative disorders, immunospecifically binds to TRAIL receptor and comprises variable heavy or light chain complementarity determining regions.

Disclosure, Page 300-301; 301pp; English.

The present inverting terrates of the invention are useful for treating, preventing or ameliorating cancer (e.g. colon, breat, uterine, pancreatic, lung, gastrointestinal or central nervous system cancer e.g. medulloblastoma, neuroblastoma, glioblastoma and Kaposi's sarcoma) in human. They are useful for detecting expression of TR4 polypeptide and detecting, diagnosing, prognosing or monitoring cancers and other hypercorrecting, diagnosing, prognosing or monitoring cancers and other hypercorrecting, diagnosing, prognosing or monitoring cancers and other hypercorrecting, preventing or ameliorating neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, cerbnitis pigmentosa, cerbelalar degeneration and Huntington's disease, immune disorders (e.g. lupus, rheumatoid arthritis, multiple sclerosis, slogren's syndrome, biliary cirrhosis, Behcet's disease, Crohn's disease, polymyositis, immune-related glomerulonephritis, myasthenia gravis, disorders (e.g. asthma, allergic disorders and rheumatoid arthritis), infectious diseases (e.g. acquired immunodeficiency syndrome (AlbS), herpes viral infections and other viral infections) and proliferative present invention relates to novel antibodies that immunospecifically

```
disorders. They are also useful for treating myelodysplastic syndromes (e.g. aplastic anaemia), ischaemic injury (such as that caused by stroke, myocardial infarction and reperfusion injury), septic shock, cachexia, anorexia and toxin-induced liver diseases (such as alcohol). They are also useful for treating cardiovascular disorders including peripheral artery diseases such as limb ischaemia, arrhythmia, congestive heart failure and cardiovascular tuberculosis, diseases or disorders associated with neovascularisation and ocular disorders, for wound healing, for promoting angiogenesis and as adjuvants to enhance immune responsiveness to specific antigen e.g. viral antigen. They are also useful in the preparation or recovery from surgery, trauma, radiation therapy and transplantation. The present sequence is human TR4 ligand, TRAIL protein
                                                                                                                                                                                                                                                                                                                                                                                                    used in the invention

                                                                                                                                                                                                                                                                                                                                                                      VHCDR1 (heavy chain variable domain complementarity determining region), VHCDR2, VLCDR3, VLCDR1 (light chain variable domain complementarity determining region), VLCDR2 or VLCDR3. The antibody or its fragment immunospecifically binds TRALL (tumour necrosis factor; TNF-related apoptosis-inducing ligand) receptor 7 (TR7). TR7 is also referred to as TRALL receptor 2 (TRAIL.R2), death receptor 5 (DR5) and KILLER. The antibody or its fragment is useful for treating, preventing or ameliorating a cancer, e.g. colon, breast, uterine, pancreatic, lung or gastrointestinal cancer or Kaposi's sarcoma or cancer of the central nervous system such as medulloblastoma, neuroblastoma or giloblastoma or graft versus host disease, AIDS (acquired immune deficiency syndrome) or a neurodegenerative disorder. The invention is useful in antibody therapy. The present sequence is human TRAIL

expressed in a disorder or process associated with DNA methylation. The combination and cDNAs are useful for diagnosing, staging, treating or monitoring treatment of cancer, e.g. colon cancer and for detecting changes in expression of genes encoding proteins that are associated with DNA methylation. The protein is useful for screening molecules or compounds to identify at least one ligand that binds to the protein and for producing an antibody. The present sequence represents the amino acid sequence of a protein expressed in a disorder or process associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DDSYWDPNDEESMNSPCWQVKWQLRQLVRKMLLRTSEETISTVQEKQQNISPLVRERGPQ 120

The invention relates to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence to polypeptide having a sequence that differs from the native sequence polypeptide having 281 amino acids given in specification. The Apo-2 ligand variant polypeptide is selected from a polypeptide having substitutions at tesidue positions identified from x-ray crystal structure of the DRS.Apo2L complex. The polypeptide having the substitutions made at residue position(s) selected from 20 positions such as S96C, 8101C, 8110C, 8115C, 8115C, 8115C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8134C, 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated Apo-2 ligand variant polypeptide useful for treating cancer or an immune-related disease such as multiple sclerosis, comprises amino acid substitutions in the native sequence of the Apo-2 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DDSYWDPNDEESMNSPCWQVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQ 120

The invention relates to an isolated nucleic acid molecule encoding a isolated antibody or its fragment is used for treating an individual in need of decreased level of endokine alpha activity. The endokine alpha polypeptide present in a heterotrimeric complex is used for treating an individual having a disorder associated with excessive bone resorption, e.g. osteoporosis, paget's disease or arterial calcification. Treating an individual having a disorder associated with insufficient bone resorption, comprises administering an endokine alpha antagonist, which is the antibody that binds specifically to endokine alpha polypeptide. The present sequence represents the amino acid sequence of a tumour necrosis factor family ligand. 181 FYYIYSQTYFRFQEEIKENTKNDKQMVQYIYKYTSYPDFILLMKSARNSCWSKDAEYGLY 240 treating a 9 New Endokine alpha gene useful for preparing a composition for treating disease associated with excessive or insufficient bone resorption e.g., osteoporosis, Paget's disease or arterial calcification. 1 MAMMEVQGGPSLGQTCVLIVIFTVLLQSLCVAVTYVYFTNELKQMQDKYSKSGIACFLKE 0; Gaps human; tumour necrosis factor; TNF ligand; endokine alpha; excessive bone resorption disorder; osteoporosis; Paget's disease; arterial calcification. The present invention describes a predictor set comprising a plurality of polymucleotides or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase pathway. Also described: (1) predicting whether a compound is capable of pathway. Also described: (1) predicting whether a compound is capable of cells, comprising obtaining a sample of cells, cerrelating the expression of the markers to the compound's ability to correlating the expression of the markers to the compound's ability to correlate the activity of the cells; (2) a plurality of cell lines for identifying polymucleotides and polypeptides whose expression levels correlate with compound sensitivity or resistance of cells associated with a disease state; and (3) identifying polymucleotides and a disease state; and (3) identifying polymucleotides that predict compounds, analysing the expression pattern of a microarray of polymucleotides or polypeptides that predict the sensitivity or cell lines to one or more compounds, analysing the expression pattern of the microarray. The polymucleotides are compounded with a disease state by using the expression pattern of the microarray. The polymucleotides are cytostatic activities, and can be used in gene therapy. The polymucleotides and polypeptides are useful in predicting the

activity of compounds that interact with protein tyrosine kinases and/or protein tyrosine kinase pathways. These may be used in determining drug sensitivity in patients to allow the development of individualized genetic profiles which aid in treating diseases and disorders (e.g. cancer) based on patient response at a molecular level. The present sequence is used in the exemplification of the present invention.

implicated in certain disease states. Compounds which modulate the proteins of the invention may have cytostatic, antiinflammatory, oppthalmological, antiatreficelerotic or vulnerary activities. The sequences of the invention may be useful for gene therapy. The invention may be useful for gene therapy. The invention may be useful for gene therapy. The invention may be useful for diagnosing or treating a hypoxia-regulated condition, such as tumourigenesis, angiogenesis, apoptosis, inflammation, erythropolesis, or the biological response to hypoxia conditions including processes such as glycolysis, gluconeogenesis, glucose transportation, catecholamine synthesis, iron transport or nitric oxide synthesis. The disease includes cancer, ischaemic conditions, reperfusion injury, retinopathy, neonatal stress, pre-eclampsia, atherosclerosis, inflammatory conditions or wound healing. The present sequence is that of a disease related protein of the invention.

The invention relates to a composition comprising several cDNAs that are differentially expressed in a liver disorder. The composition is useful for treating liver disorder such as hyperlipidaemia, hypertension, type II diabetes, tumours of the liver and disorders of the inflammatory and immune response. The composition is useful for a high-throughput method of screening several molecules or compounds to identify a ligand which specifically binds a CDNA. A protein encoded by the CDNA is useful for a high-throughput method for using a protein to screen several molecules or compounds to identify at least one ligand which specifically binds the protein which involves combining the protein encoded by the CDNA with several of molecules or compounds under conditions to allow specific binding a ligand which specifically binds the protein. The composition is useful for detecting and molecule or compound, therefore identifying a ligand which specifically binds the protein. The composition is useful for detecting and communate prognosis and to design a treatment regimen and to monitor the efficacy of treatment. The present sequence represents the amino acid sequence of a protein encoded by a CDNA differentially expressed in a
                                                                                                             Composition comprising several cDNAs that are differentially expressed in treated human C3A liver cell cultures, useful for treating liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            121 RVAAHITGTRGRSNTLSSPNSKNEKALGRKINSWESSRSGHSFLSNLHLRNGELVIHEKG 180

This is the amino acid sequence of human TL2 (also known as TRAIL), which has newly been discovered to be a ligand of human tumour necrosis related receptor TR5 (see AAWF6311). This TR5 polypeptide of the invention and TL2 can be used in screening processes for compounds which bind the receptor, or its ligand, and which activate (agonists) or inhibit (antagonists) the receptor or TL2. Treatment of a subject with the need to inhibit TR5 polypeptide activity comprises administering an antagonist to the polypeptide, administering a nucleic acid that inhibits the expression of the nucleotide sequence encoding the polypeptide and/or administering a polypeptide that competes with the polypeptide for its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SYNDPNDEESMNSPCMOVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQRV 122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       181 YIYSQTYFRFQEEIKENTKNDKQMVQYIYKYTSYPDPILLMKSARNSCWSKDAEYGLYSI 240
                                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotide encoding TR5 polypeptide - used to diagnose, prevent and treat e.g. inflammation, arthritis, septicaemia, autoimmune diseases, infections, stroke, ischaemia, ARDS, psoriasis, restenosis, brain injury,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ligand, substrate or receptor. The active agents on be used for the treatment of chronic and acute inflammation, arthritis, septicaemia, autoimmune diseases (-g. inflammatory bowel disease, psoriasis), transplant rejection, graft vs host disease, infection, stroke, ischaemia, acute respiratory disease syndrome, restenosis, brain injury, AIDS, bone diseases, cancer (e.g. lymphoproliferative disorders), atherosclerosis and Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 SYWDENDEESMNSPCWQVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQRV

The present sequence represents a TNF-R related polypeptide TL2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to identifying agonists or antagonists to tumour necrosis factor receptor (TNF-R) related polypeptides (TR1 and TR2, TL2 and TL4). The method comprises: (a) (i) contacting TR1 or TR2 with a candidate compound in the presence of TL4 or (ii) contacting TL2 or TL4 with a candidate compound in the presence of TR1; and (b) assessing the ability of the candidate compound to compete with TR1 or TR2 binding to TL2 or TL4. TR and TL agonists and antagonists are useful for treating diseases caused by imbalance of TL or TR polypeptide levels, which cause: chronic and acute inflammation, arthritis, septicemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SYMDPNDEESMNSPCWQVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQRV 122

(Apo-21). The Apo-21 polypeptide can be produced by standard recombinant methodology. Apo-21 is useful for inducing apoptosis in mammalian cancer cells. This is useful for the treatment of cancer. Apo-21 can be used to induce apoptosis for pathological conditions characterized by decreased to induce apoptosis for pathological conditions characterized by decreased mediated glomerular nephritis and cancer. Apo-21 and its nucleic acid coding sequence can also be used in quantitative and screening diagnostic techniques. Anti-Apo-21 antibodies can be used for treating diseases associated with increased apoptosis. Sequences AAY27016-19 represent specific examples of Apo-21 variants. Note: This sequence is not provided in the specification. It has been created by modifying the wild-type Apo-21 sequence provided in Fig 1A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0

The invention relates to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence having 281 amino acids given in specification. The Apo-2 ligand variant polypeptide is selected from a polypeptide having substitutions at residue positions identified from x-ray crystal structure of the DRS.Apo2L complex. The polypeptide having the substitutions made at residue position(s) selected from 20 positions such as S9CC, 510IC, 511IC, V114C, R115C, E116C, N134C, E144C, N152C, S153C, R170C, S111C, V114C, R115C, E116C, N134C, E25C, E263C, H264C, such that the residue position is, outside of the receptor contact region of the DRS.Apo2L complex, and displays high solvent accessibility in the crystal structure of the DRS.Apo2L complex. The Apo-2 ligand variant polypeptide and further compositions have the following activities: cytostatic, antiarthritic and neuroprotective. The Apo-2 ligand variant polypeptide,
                                                                                                            180

an Apo-2 ligand composition or an Apo-2 ligand trimer are useful for inducting apoptosis in mammalian cells, by exposing mammalian cells expressing a receptor selected from DR4 receptor and DR5 receptor to a therapeutically effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. The mammalian cells are colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, colon or colorectal cancer) or immune-related disease (such as arthritis or multiple sclerosis) in a mammal, by administering to the mammal an effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. This sequence represents the human Apo-2 ligand mutant H264C protein of the invention. NOTE: This sequence is not shown in the specification. It has been created from information provided in claim 1 and from the sequence in Fig 1 of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 DDSYWDPNDEESMNSPCWQVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQ 120

The invention relates to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence to polypeptide having as equence that differs from the native sequence comparing as animo acide given in specification. The Apo-2 ligand variant polypeptide is selected from a polypeptide having the substitutions at the polypeptide having the substitutions at the polypeptide having the substitutions and at the polypeptide having the substitutions and the polypeptide having the substitutions and and at the polypeptide having the substitutions and the polypeptide having the substitutions and an are a selected from 20 positions such as $960, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100, $1100
                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated Apo-2 ligand variant polypeptide useful for treating cancer or an immune-related disease such as multiple sclerosis, comprises amino acid substitutions in the native sequence of the Apo-2 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 specification. It has been created from information provided in claim 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    from the sequence in Fig 1 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; Page; 92pp; English.

Novel isolated Apo-2 ligand variant polypeptide useful for treating cancer or an immune-related disease such as multiple sclerosis, comprises amino acid substitutions in the native sequence of the Apo-2 ligand.

Claim 1; Page; 92pp; English.

The invention relates to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence having a sequence that differs from the native sequence having all amino acids given in specification. The Apo-2 ligand variant polypeptide is selected from a polypeptide having substitutions at residue positions identified from 20 positions such as S96C, S101C, S12C, W14C, R115C, R1

The Apo-2 ligand variant polypeptide is selected from a polypeptide having substitutions at residue positions identified from x-ray crystal structure of the DRS.Apo2L complex. The polypeptide having the substitutions made at

                                                                                                                                                                                                            The specification describes the use a polypeptide corresponding to at least the primary sequence of part of the present sequence to produce a diagnostic, prophylactic or therapeutic composition useful in cases of degenerative, autoimmus and inflammatory diseases. The polypeptides can be used in treatment of neurodegenerative disease, The polypeptides can rhuematoid arthritis, and SEP. The polypeptides are apoptotic in central nervous system cells, antigenic and specifically recognise the surface receptor of the TRAIL protein. The polypeptide is a marker of disease and a therapeutic target, e.g. its apoptotic activity can be blocked with an anti-TRAIL antibody or a TRAIL equivalent that binds to specific receptors, inhibiting formation of natural complex

tumour-targetted bacteria, such as, eg., Salmonella, as a vector for the delivery of one or more primary effector molecules and secondary effector molecules to the site of a solid tumour. The primary effector molecules of the invention include members of the tumour necrosis factor (TMP), anti-angiogenic factors, cytotoxic polypeptides and tumour inhibitory enzymes. They induce a local immune response at the site of the tumour that results in the inhibition of growth of a tumour or tumour cells. The primary effector molecules are used for the treatment of solid tumours such as acroinomas, melanomas, lyaphomas, sarcomas or metastases derived from these tumours. The present sequence is ompa signal peptide-mature human TMF-alpha-related apoptosis-inducing ligand (TRAIL) fusion protein. The fusion of Ompa signal peptide to the amino terminus of TRAIL effector molecule enhances the periplasmic localisation and subsequent processing of the effector molecule. The invention relates to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence having 281 amino acids given in specification. The Apo-2 ligand variant oblypeptide is selected from a polypeptide having substitutions at residue positions identified from x-ray crystal structure of the DRS-Apo2L complex. The polypeptide having the substitutions ande at residue position(s) selected from 20 positions such as S96C, S101C, S111C, V114C, R170S, R179C, D234C, R25C, E263C, H264C, such that the residue position is, outside of the receptor contact region of the DRS-Apo2L complex, and displays high solvent accessibility in the crystal structure of the DRS-Apo2L complex. The Apo-2 ligand variant polypeptide and thather compositions have the following activities: cytosfatic, and thather than neuroprotective. The Apo-2 ligand variant polypeptide, an Apo-2 ligand composition or an Apo-2 ligand trimer are useful for inducting apoptosis in mammalian cells, by exposing mammalian cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated Apo-2 ligand variant polypeptide useful for treating cancer or an immune-related disease such as multiple sclerosis, comprises amino acid substitutions in the native sequence of the Apo-2 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        expressing a receptor selected from DA4 receptor and DR5 receptor to a heargebulfoally effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. The mammalian cells are colon or colorectal cancer cells. The Apo-2 ligand trimer is useful for treating cancer (such as lung, breast, colon or colorectal cancer) or an immune-related disease (such as arthritis or multiple sclerosis) in a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel human cytokine, designated Apo-2 ligand (Apo-2L). The Apo-2L polypeptide can be produced by standard recombinant
mammal, by administering to the mammal an effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. This sequence represents the human Apo-2 ligand mutant D234C protein of the invention. NoTE: This sequence is not shown in the specification. It has been created from information provided in claim 1 and from the sequence in Fig 1 of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cytokine; Apo-2 ligand; Apo-2L; apoptosis; cancer; autoimmune disorder; lupus; immune-mediated glomerular nephritis; human; variant.

methodology. Apo-2L is useful for inducing apoptosis in mammalian cancer cells. This is useful for the treatment of cancer. Apo-2L can be used to induce apoptosis for pathological conditions characterized by decreased levels of apoptosis, e.g. autoimmune disorders like lupus and immune-mediated glomerular nephritis and cancer. Apo-2L and its nucleic acid coding sequence can also be used in quantitative and screening disquestive techniques. Anti-Apo-2L antibodies can be used for treating dispositive techniques. Anti-Apo-2L antibodies can be used for treating diseases associated with increased apoptosis. Sequences AAY27016-19 represent in the specification. It has been created by modifying the wild-type Apo-2L sequence provided in Fig 1A

```
The invention relates to a novel human cytokine, designated Apo-2 ligand (Apo-21). The Apo-21 polypeptide can be produced by standard recombinant methodology. Apo-21 is useful for inducing apoptosis in mammalian cancer cells. This is useful for the treatment of cancer. Apo-21 can be used to induce apoptosis for pathological conditions characterized by decreased levels of apoptosis, e.g. autoimmune disorders like lupus and immunemediated glomerular nephritis and cancer. Apo-21 and its nucleic acid coding sequence can also be used in quantitative and screening dispassed techniques. Anti-Apo-21 antibodies can be used for treating diseases ssociated with increased apoptosis. Sequences AAY27016-19 represent specific examples of Apo-21 variants. Note: This sequence is not provided in the specification. It has been created by modifying the wild-type Apo-21 sequence provided in Fig 1A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DDSYWDPNDEESMNSPCWQVKWQLRQLVRKMILRISEETISTVQEKQQNISPLVRERGPQ 120

The invention relates to a novel human cytokine, designated Apo-2 ligand (Apo-21). The Apo-21 is useful for inducing apoptosis in mammalian cancer cells. This is useful for inducing apoptosis in mammalian cancer induce apoptosis for pathological conditions characterized by decreased to induce apoptosis for pathological conditions characterized by decreased mediated glomerular nephritis and cancer. Apo-21 and its nucleic acid coding sequence can also be used in quantitative and screening disappositic techniques. Anti-Apo-22 antibodies can be used for treating diseases associated with increased apoptosis. Sequences AAY27016-19 represent specific examples of Apo-21 variants. Note: This sequence is not provided in the specification. It has been created by modifying the wild-type Apo-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RVAAHITGTRGRSNTLSSPNSKNEKALGRKINSWESSRSGHSFLSNLHLRNGELVIHEKG 180

                                                                                                                                                                                                                                                                                                                                 tumour related apoptosis inducing ligand (Trail), and the Trail protein. The Trail full length CDNA is cloned, and is utilised to create a Trail protein. The Trail full length CDNA is used to respectively clone cDNA of soluble ectocytic segment Trail109 and Trail 114, and respectively clone cDNA of sculple ectocytic segment Trail1109 and Trail 114, and respectively create Trail109 cDNA and Trail114 cDNA prokaryotic expression systems. The prokaryotic expression systems created greatly increase the expression and quantity of the Trail 109, and Trail114 proteins, and may be useful in a new preparation for killing tumour cells. The present sequence represents the full length human Trail
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 DDSYWDPNDEESMNSPCWQVKWQLRQLVRKMILRTSEETISTVQEKQONISPLVRERGPQ 120

Side effects. Thus, TRAIL has the potential to be a very useful antitumour agent. The naturally occurring splice variants may differ in their cellular distribution, expression levels/timing and activity.

Their cellular distribution, expression levels/timing and activity.

Determining these factors could provide possible mechanisms for the induction of apoptosis of tumours cells. The splice variant polypeptides and polymucleotides can be used in gene therapy, to raise antibodies, to detect the levels, distribution and ratios of expression of TRAIL, and its splice variants, in a biological sample and to identify compounds which bind the variant TRAIL products and modulate its activity (agonists of and antagonists). Pharmaceutical compositions, comprising an expression vector or any of the amino acid sequences, are useful for causing a cytotoxic effect in cancer cells and for treatment of diseases which can be ameliorated, cured or prevented by lowering or raising the level of the amino acid sequences. The antibodies may also have a therapeutic cutility in blocking or decreasing the activity of the TRAIL variant condiseases, diseases involved in the non-normal and any and any and any activity of the family and any and any activity of the reached any and any and any activity of the reached any activity of the non-normal and any activity of its normal and any activity of its normal and any activity of the reached any activity of the reached any activity of the reached any activity of the reached any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity of any activity and any activity of any activity and any activity and any activity and any activity and any activity and any activity and any activi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention discloses isolated, naturally occurring, polypeptide splice variants of human tumour necrosis factor (TNF)-related apoptosis inducing ligand (TRAIL). Apoptosis, or programmed cell death, occurs during normal cellular differentiation and development of multicellular organisms.

Apoptosis is induced by certain cytokines which include TNF and TRAIL also referred to as Apo-2 ligand, Apo-21). TRAIL is a type II membrane protein which induces apoptosis and nuclear factor-B (NF-B) activation in many tissues and cells. Receptors for TRAIL include two death domain proceptors, DR4 and DR5, as well as two decoy receptors, DCRI and DCR2, lacking receptors, induces apoptosis in tumour cells, whereas normal cells are relatively resistant without showing significant toxic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diseases, unterdommune diseases, diseases involved in the controlled on chromosome development of tissues and aging. TRAIL's gene is located on chromosome development of tissues and aging. TRAIL's gene is located on chromosome 3q26. The sequence presented is the human TNF-related apoptosis inducing 3q26. The sequence presented is trol-6-6, protein which has had an C-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New splice variants of tumor necrosis factor-related apoptosis inducing ligand (TRAIL) isolated from B-lymphocytes and liver, useful to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ligand (TRAIL) isolated from B-lymphocytes and liver, useful to treat diseases or disorders associated with low expression of the variants.
                                                                                                                                                                                                                /note= "Encoded by in-frame stop codon"

The invention relates to a cytokine designated as tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL), which induces apoptosis of certain target cells, including cancer cells and virally infected cells. The TRAIL polypeptides are useful in killing cancer cells, in treating viral infections (e.g. bovine viral diarrhoea or human immunodeficiency virus (HIV)) and cancers (e.g. leukaemia, lymphoma and melanoma), as a research reagent useful in studying apoptosis including the regulation of programmed cell death. TRAIL DNA sequences may be employed in developing a gene therapy approach to treating disorders mediated by defective or insufficient amounts of TRAIL, in the production of TRAIL polypeptides and as probes or primers in polymerase chain reactions (PCR). The present sequence is growth hormone (GH)-derived leader peptide-leucine zipper-human TRAIL fusion protein

human tumor necrosis factor (TNF) related apoptosis inducing ligand
(TRAIL) protein appearing as ABU08558; (b) a soluble human TRAIL
polypeptide, (c) a polypeptide comprising amino acids 124-276 of
polypeptide, (c) a fragment of the TRAIL protein. Also included is an antigen-binding fragment of the antibody (a monoclonal antibody), a hybridoma cell line that produces the antibody. The antibody is used in assays to detect the presence of TRAIL polypeptides, either in vitro or in vivo, purifying TRAIL by affailty chromatography, blocking binding of TRAIL to target cells and thus inhibiting a biological activity of TRAIL.
TRAIL e.g. thrombotic microangiopathies, e.g. thrombotic
thrombocytopaenic purpura (TTP), adult haemolytic uraemic syndrome (HUS)
(even though it can strike children as well) small blood vessel clotting
disorders e.g., cardiac problems in paediatric AIDS patients and systemic
lupus erythematosus (SLB). The present sequence represents a growth
commone signal peptide/leucine zipper/TRAIL 95-281 fusion protein

The invention relates to an antibody that specifically binds: (a) the human tumor necrosis factor (TNF) related apoptosis inducing ligand (TRAIL) protein appearing as ABU08558; (b) a soluble human TRAIL polypeptide: (c) a polypeptide comprising amino acids 124-276 of ABU08558, or (d) a fragment of the TRAIL protein. Also included is an antiqen-binding fragment of the antibody (a monoclonal antibody), a hybridoma cell line that produces the antibody. The antibody is used in vivo, purifying TRAIL by affinity chromatography, blocking binding of TRAIL to target cells and thus inhibiting a biological activity of TRAIL. C. The antibody is useful for treating disorders mediated or exacerbated by TRAIL, e.g. thrombotic microangiopathies, e.g. thrombocic thrombotic microangiopathies, e.g. thrombocic chromotic microangiopathies, e.g. thrombocic chromotic purpura (TTP), adult haemolytic uraemic syndrome (HUS) (even though it can strike children as well) small blood vessel clotting disorders e.g. cardiac problems in paediatric AIDS patients and systemic lupus erythematosus (SLB). The present sequence represents a CMV (human proper in the partial peptide/leucine zipper/TRAIL 95-281 fusion
                                                                                                                                    The invention relates to a cytokine designated as tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL), which induces apoptosis of certain target cells, including cancer cells and virally infected cells. The TRAIL polypeptides are useful in killing cancer cells, in treating viral infections (e.g. bovine viral diarrhoea or human immunodeficiency virus (HIV)) and cancers (e.g. leukaemia, lymphoma and melanoma), as a research reagent useful in studying apoptosis including the regulation of programmed cell death. TRAIL DNA sequences may be employed in developing a gene therapy approach to treating disorders mediated by defective or insufficient amounts of TRAIL, in the production of TRAIL polypeptides and as probes or primers in polymerase chain reactions (PCR). The present sequence is a DNA encoding cytomegalovirus (CMV)-derived leader peptide-leucine zipper-human TRAIL fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     155 ESSRSGHSFLSNLHLRNGELVIHEKGFYYIYSQTYFRRQEEIKENTKNDKQMVQYIYKYT 214

```
The present invention relates to proteins comprising a segment with biological activity for a specific target molecule, a peptide linker, and a segment that is an antibody (or fragment) that recognises a specific target molecule on a cell surface. In absence of site-specific and/or segment bas no biological activity. The proteins are useful in the treatment of cancers, infections (bacterial, viral or protozol), metabolic diseases, inflammatory states (including allergy and transplant rejection), and autoimmune diseases, especially rheumatic/arthritic diseases but also multiple sclerosis and diabetes. The present sequence is a fusion protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ద
                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                            The present invention relates to proteins comprising a segment with biological activity for a specific target molecule, a peptide linker, and a segment that is an antibody (or Iragment) that recognises a specific target molecule on a cell surface. In absence of site-specific and/or selective binding of the antibody to the target, the biologically active segment has no biological activity. The proteins are useful in the treatment of cancers, infections (bacterial, viral or protozoal), metabolic diseases, inflammatory states (including allergy and transplant rejection), and autoimmune diseases, especially rheumatic/arthritic diseases but also multiple sclerosis and diabetes. The present sequence is a fusion protein of the invention

The present invention relates to proteins comprising a segment with biological activity for a specific target molecule, a peptide linker, and as esgment that is an antibody (or fragment) that recognises a specific target molecule on a cell surface. In absence of site-specific and/or selective binding of the antibody to the target, the biologically active segment has no biological activity. The proteins are useful in the treatment of cancers, inflections (bacterial, viral or protozoal), metabolic diseases, inflammatory states (including allergy and transplant rejection), and autoimmune diseases, especially rheumatic/arthritic diseases but also multiple sclerosis and diabetes. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TSEETISTVQEKQQNISPLVRERGPQRVAAHITGTRGRSNTLSSPNSKNEKALGRKINSW

```

The present sequence is an AGP-1 fusion protein. AGP-1 is a type II transmembrane protein. The fusion proteins comprise an Fc immunoglobulin region fused to the N-terminal portion of the AGP-1 protein. The fusion proteins can be used to induce apoptosis in a tissue, and to treat proliferative disorders, immune disorders, or virally-induced disorders, proliferative disorders include cancers, such as breast, prostate, lung or colon cancer. The viral infections include hepatitis, and acquired immunodeficiency syndrome (AIDS), and the immune disorders may be autoimmune disorders or transplant rejection. Cardiovascular diseases such as arteriosclerosis may also be treated. The AGP-1 containing fusion proteins used in prior art therapies

The invention trainers to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence baving 281 amino acids given in specification. The Apo-2 ligand variant polypeptide lawing substitutions at residue positions identified from x-ray crystal structure of the residue positions identified from x-ray crystal structure of the residue position(s) selected from 20 positions such as 396°, 810°C, 811°C, V114°C, 811°C, V114°C, 811°C, V114°C, 811°C, V114°C, 811°C, V114°C, 811°C, V114°C, 811°C, V114°C, 811°C, V114°C, 811°C, V114°C, 811°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81°C, 81

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polypeptide having a sequence that differs from the native sequence having 281 amino acids given in specification. The Apo-2 ligand variant polypeptide is selected from a polypeptide having substitutions at residue positions identified from r-yatal structure of the DRS.Apo2L complex. The polypeptide having the substitutions made at residue position(8) selected from 20 positions such as S96C, S101C, S111C, V114C, R115C, B116C, N134C, R14C, R14C, S153C, R170C, R170K, R170S, R179C, D234C, E249S, R255C, E263C, H264C, such that the residue position is, outside of the receptor contact region of the DRS.Apo2L complex, and displays high solvent accessibility in the crystal

and further of the DRS.Apo2L complex. The Apo-2 ligand variant polypeptide and further compositions have the following activities: cytostatic, antiatrhritic and neuroprocective. The Apo-2 ligand variant polypeptide, an Apo-2 ligand composition or an Apo-2 ligand trimer are useful for cytostasing a receptor selected from DR4 receptor and DR5 receptor to a therapeutically effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. The mammalian cells are colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or Apo-2 ligand trimer is useful for treating cancer (such as lung, breast, colon or colorectal cancer) or immune-related disease (such as arthritis or multiple sclerosis) in a mammal, by administering to the mammal an effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand composition or Apo-2 ligand composition or Apo-2 ligand composition or Apo-2 ligand for the Apo-2 ligand composition or Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand for the Apo-2 ligand mutant R115C protein of the invention. Word: This sequence is not shown in the sequence in Fig 1 of the specification provided in claim 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240

Novel isolated Apo-2 ligand variant polypeptide useful for treating cancer or an immune-related disease such as multiple sclerosis, comprises amino acid substitutions in the native sequence of the Apo-2 ligand. Claim 1; Page; 92pp; English.

The invention relates to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence polypeptide having a sequence that differs from the native sequence having all amino acids given in specification. The Apo-2 ligand variant polypeptide is selected from a polypeptide having substitutions at the polypeptide having the substitutions and the polypeptide having the substitutions and the polypeptide having the substitutions and the polypeptide having the substitutions made at cresidue position(s) selected from 20 positions subtained at 20 positions with the polypeptide having the substitutions made at creature position(s) selected from 20 positions as 596C, S101C, S111C, V114C, R115C, E116C, N134C, N149C, E149C, E255C, E263C, H264C, such that the creature position is, outside of the receptor contact region of the DRS.Apo2L complex. The Apo-2 ligand variant polypeptide, and further compositions have the following accivities: cytostatic, and harden composition or an Apo-2 ligand variant polypeptide, antiarthritic and neuroprotective. The Apo-2 ligand variant polypeptide, conducing apoptosis in mammalian cells, by exposing mammalian cells are colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand variant polypeptide, colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide, colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide, colon or colorectal cancer cells. The Apo-2 ligand decreases) or an immune-related disease (such as arthritis or multiple sclerosis) in a mammal by broad and ministering to the mammal an effective amount of the Apo-2 ligand composition or Apo-2 ligand composition or Apo-2 ligand composition or Apo-2 ligand composition or Apo-2 ligand composition or the mammal and colorectal cancer (such as arthritis color or colorectal cancer cells and colorectal cancer cells and composition or Apo-2 ligand composition or Apo-2 ligand composition or Apo-2 ligand composition or co specification. It has been created from information provided in claim 1 and from the sequence in Fig 1 of the specification.

Sequence 281 AA;

The invention relates to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence that differs from the native sequence comparing a sequence that differs from the native sequence comparing all amino acids given in specification. The Apo-2 ligand variant polypeptide is selected from a polypeptide having substitutions at the polypeptide having the substitutions and eat comparing the substitutions and eat comparing the substitutions and eat comparing the substitutions and eat comparing the substitutions and eat comparing the substitutions and eat comparing the receptor contact region of the DRS.Apo2L complex. The Apo-2 ligand variant polypeptide composition is outside of the receptor contact region of the compositions have the following activities: cytostatic, and further compositions have the following activities: cytostatic, and Apo-2 ligand compositions are useful for contact receptor selected from DR4 receptor and DR5 receptor to a natiarthritic and neuroprotective. The Apo-2 ligand variant polypeptide, contacting apoptosis in mammalian cells, by exposing mammalian cells are colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. The mammalian cells colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, colon or colorectal cancer cells. The Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand variant polypeptide, colon or colorectal cancer cells. The Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the

and from the seguence in Fig 1 of the specification.

cc polypeptide is selected from a polypeptide having substitutions at residue positions identified from x-ray crystal structure of the DRS.Apo2L complex. The polypeptide having the substitutions made at residue position(s) selected from X-ray crystal structure of the polypeptide from X-ray crystal structure of the RISC, RIJGC, M134C, N140C, E144C, N152C, S153C, RIJOC, S111C, V114C, RIJSC, RIJGC, M134C, N140C, E144C, N152C, S153C, RIJOC, RIJOC, RIJOC, RIJOC, RIJOC, RIJOC, E249C, R255C, E263C, H264C, such that the creatidue position is, outside of the receptor contact region of the residue position is, outside of the receptor contact region of the RIS.Apo2L complex. The Apo-1 ligand variant polypeptide and further compositions have the following activities: cytostatic, and have the following activities: cytostatic, and neuroprotective. The Apo-2 ligand variant polypeptide, an Apo-2 ligand composition or an Apo-2 ligand variant polypeptide, conducing apoptosis in mammalian cells, by exposing mammalian cells are therapeutically effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. The mammalian cells are colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or the Apo-2 ligand variant polypeptide, colon or colorectal cancer (such as lumi), breach, colon or colorectal cancer) or immune-related disease (such as archritis or multiple sclerosis) in a mammal, by administering to the mammal an effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand composition or the Apo-2 ligand wariant sill colorected contacted from information provided in claim in the specification. It has been created from information. Colorected in Fig 1 of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120

```
The invention relates to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence having a sequence that differs from the native sequence having all amino acids given in specification. The Apo-2 ligand variant polypeptide is selected from a polypeptide having substitutions at the polypeptide having the substitutions at the polypeptide having the substitutions and the polypeptide having the substitutions and the treatide position(s) selected from 20 positions such as 596c, S101C, S111C, V114C, R115C, E116C, N134C, N140C, E144C, N152C, S153C, R170C, R170K, R170S, K179C, D234C, E249C, R25C, E263C, 1264C, such that the residue position is, outside of the receptor contact region of the DRS.Apo2L complex, The Apo-2 ligand variant polypeptide and further compositions have the following accivities: cytostatic, and Apo-2 ligand compositions have the Apo-2 ligand variant polypeptide, an Apo-2 ligand composition or an Apo-2 ligand variant polypeptide, charapeutically effective amount of the Apo-2 ligand variant polypeptide, charapeutically effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or the Apo-2 ligand variant polypeptide, colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide, colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide, colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide, colon or colorectal cancer cells. The Apo-2 ligand composition or the Apo-2 ligand variant polypeptide, colon or colorectal cancer cells. The Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand variant polypeptide, and mammal an effective amount of the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated Apo-2 ligand variant polypeptide useful for treating cancer or an immune-related disease such as multiple sclerosis, comprises amino acid substitutions in the native sequence of the Apo-2 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  specification. It has been created from information provided in claim 1 and from the sequence in Fig 1 of the specification.
                                                    /note= "Native residue of Glu is substituted by Cys"

Dispeptide having a sequence that differs from the native sequence having all minoractions at the native sequence having about the native sequence having about the native sequence having 281 amino acids given in specification. The Apo-2 ligand variant polypeptide is selected from a polypeptide having substitutions at residue positions identified from x-ray crystal structure of the DRS.Apo2L complex. The polypeptide having the substitutions made at residue position(s) selected from 20 positions such as 586C, 810C, 8101C, 811C, R115C, R15C, R249C, R255C, E263C, H264C, such that the residue position is, outside of the receptor contact region of the DRS.Apo2L complex, and displays high solvent accessibility in the crystal structure of the DRS.Apo2L complex. The Apo-2 ligand variant polypeptide and tharther compositions have the following activities: cytostatic, and neuroprotective. The Apo-2 ligand variant polypeptide, an Apo-2 ligand composition or an Apo-2 ligand trimer are useful for inducing apoptosis in mammalian cells, by exposing mammalian cells are therapeutically effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. The mammalian cells are colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or the Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or the Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or the Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or the Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or the Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or the Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or the Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or colo

The invention relates to a novel isolated Apo-2 ligand variant

```
Novel isolated Apo-2 ligand variant polypeptide useful for treating cancer or an immune-related disease such as multiple sclerosis, comprises amino acid substitutions in the native sequence of the Apo-2 ligand.

immune-related disease (such as arthritis or multiple sclerosis) in a mammal, by administering to the mammal an effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. This sequence represents the human Apo-2 ligand mutant R170C protein of the invention, NOTE: This sequence is not shown in the specification. It has been created from information provided in claim 1 and from the sequence in Fig 1 of the specification.

The invention relates to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence having 281 amino acids given in specification. The Apo-2 ligand variant collypeptide having substitutions at residue positions identified from x-ray crystal structure of the DAY-Poptide positions identified from 20 positions such as 596C, S101C, V114C, R115C, B116C, M134C, M140C, E144C, M152C, S153C, R170C, S111C, V114C, R115C, E116C, M134C, R255C, E263C, H264C, such that the CRIVOK, R170S, K179C, D234C, E249C, R255C, E263C, H264C, such that the CRIVOK, R170S, K179C, D234C, E249C, R255C, E263C, H264C, such that the CRIVOK, R170S, K179C, D234C, E249C, R255C, E263C, H264C, such that the CRIVOK, R170S, K179C, D234C, E249C, R255C, E263C, H264C, such that the CRIVOK, R170S, K179C, D234C, E249C, R255C, E263C, H264C, such that the CRIVOK, R170S, K179C, D234C, E249C, R255C, E263C, H264C, such that the CRIVOK, R170S, K179C, D234C, E249C, R255C, E263C, H264C, such that the CRIVOK, R170S, M19C, D234C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E340C, E34

Novel isolated Apo-2 ligand variant polypeptide useful for treating cancer or an immune-related disease such as multiple sclerosis, comprises amino acid substitutions in the native sequence of the Apo-2 ligand.

Claim 1; Page; 92pp; English

The invention relates to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence having 281 amino acids given in specification. The Apo-2 ligand variant polypeptide is selected from a polypeptide having substitutions dat casique positions identified from x-ray crystal structure of the residue positions identified from x-ray crystal structure of the DRS.Apo2L complex. The polypeptide having the substitutions and residue positions is elected from x-ray crystal structure of the residue position; selected from x-ray orystal structure of the TATOK, RITOS, E116C, N134C, N134C, N140C, E144C, N152C, S133C, R170C, S111C, V114C, R115C, E116C, N134C, N145C, E146C, S115C, S133C, R170C, S111C, V114C, R115C, E116C, N134C, N255C, E263C, E263C, E264C, such that the residue position is, outside of the receptor contact region of the DRS.Apo2L complex. The Apo-2 ligand variant polypeptide and further compositions have the following activities: cytostatic, antiarthritic and neuroprotective. The Apo-2 ligand variant polypeptide, antiariar are useful for inducing apoptosis in mammalian cells, by exposing mammalian cells are therapeutically effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. The mammalian cells are colorectal ancer cells. The Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or Apo-2 ligand trimer. The mammalian cells are colorectal ancer cells. The Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypeptide, the Apo-2 ligand variant polypepti the Apo-2 ligand composition or the Apo-2 ligand trimer is useful for treating cancer (such as lung, breast, colon or colorectal cancer) or an immune-related disease (such as arthritis or multiple sclerosis) in a mammal, by administering to the mammal an effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. This sequence represents the human Apo-2 ligand mutant K199C procesin of the invention. NOTE: This sequence is not shown in the specification. It has been created from information provided in claim 1 and from the sequence in Fig 1 of the specification.

Novel isolated Apo-2 ligand variant polypeptide useful for treating cancer or an immune-related disease such as multiple sclerosis, comprises amino acid substitutions in the native sequence of the Apo-2 ligand.

Claim 1; Page; 92pp; English.

The invention relates to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence that differs from the native sequence below a cids given in specification. The Apo-2 ligand variant oplypeptide is selected from a polypeptide having substitutions at residue positions identified from x-ray crystal structure of the DRS.Apo2L complex. The polypeptide having the substitutions made at residue positions is selected from 20 positions such as S96C, S10C, S11C, V114C, R115C, E116C, N134C, N140C, E144C, N152C, S13C, R170C, R1

```
an Apo-2 ligand composition or an Apo-2 ligand trimer are useful for inducing apoptosis in mammalian cells, by exposing mammalian cells expressing a receptor selected from DR4 receptor and DR5 receptor to a therapeutically effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. The mammalian cells are colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide, treating cancer (such as lung, breast, colon or colorectal cancer) or an immune-related disease (such as arthritis or multiple sclerosis) in a mammal, by administering to the mammal an effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. This sequence represents the human Apo-2 ligand mutant Sillic protein of the invention. NOTE: This sequence is not shown in the appecification. It has been created from information provided in claim 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                       and from the sequence in Fig 1 of the specification.

Novel isolated Apo-2 ligand variant polypeptide useful for treating

```
The invention relates to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence having a sequence that differs from the native sequence having all amino acids given in specification. The Apo-2 ligand variant polypeptide is selected from a polypeptide having substitutions at residue positions identified from x-ray crystal structure of the DRS.Apo2L complex. The polypeptide having the substitutions made at residue position(s) selected from 20 positions such as 596c, S101c, S111c, V114c, R115c, E116c, N134c, N140c, E144c, N152c, S153c, R170c, R170s, K179c, D214c, E249c, R255c, E263c, H264c, such that the recidue position is, outside of the receptor contact region of the DRS.Apo2L complex, and displays high solvent accessibility in the crystal structure of the DRS.Apo2L complex. The Apo-2 ligand variant polypeptide and further compositions have the following activities: cytostatic, and houroprotective. The Apo-2 ligand variant polypeptide, an Apo-2 ligand composition or an Apo-2 ligand variant polypeptide, an Apo-2 ligand composition or an Apo-2 ligand variant polypeptide, colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or the Apo-2 ligand variant polypeptide, the Apo-2 ligand composition or the Apo-2 ligand variant polypeptide, the mammal, by administering to the mammal an effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or the Apo-2 ligand composition or the Apo-2 ligand wariant polypeptide, trimer. This sequence represents the human Apo-2 ligand mutant V114c protein of the invention. NOTE: This sequence in Pig 1 of the specification. It has been created from information.
cancer or an immune-related disease such as multiple sclerosis, comprises amino acid substitutions in the native sequence of the Apo-2 ligand.

Lindstrom SH; (GETH) GENERATECH INC. WPI; 2003-541400/51. Misc-difference 153 WO2003029420-A2 Homo sapiens. 10-APR-2003. Kelley RF,

Novel isolated Apo-2 ligand variant polypeptide useful for treating cancer or an immune-related disease such as multiple sclerosis, comprises amino acid substitutions in the native sequence of the Apo-2 ligand.

Claim 1; Page; 92pp; English.

The invention relates to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence complex by a sequence that differs from the native sequence baring 281 amino acids given in specification. The Apo-2 ligand variant polypeptide is selected from a polypeptide having substitutions at residue positions identified from x-ray crystal structure of the cresidue position is, outsided from 20 positions such as S96C, 1810C, 1815C,

Sequence 281 AA;
